SAFe advocates alignment, collaboration, and delivery across numerous agile teams. It provides the structure for Agile/Lean software development, lean product development, and systems thinking-its three centers of proficiency.

SAFe delivers a structured approach that scales for the Agile methodology across any business size. There are four SAFe configurations: Essential SAFe, Large Solution SAFe, Portfolio SAFe, and Full SAFe.

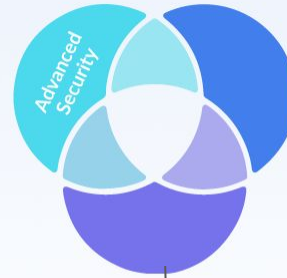

3insys has adopted the Full SAFe methodology, which is implemented using software products such as Jira and Bitbucket. This software addresses customer requirements within the DevOps methodology through automated and continuous exploration, integration, and deployment processes. Full SAFe adheres to a customer-centric mindset defined in the framework and is applied across all solutions.

Integration page section 3

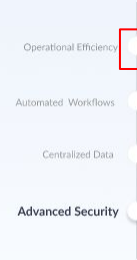

Security. Security. Security.

"There's no such thing as having too much security to protect your data, systems, or devices. What's exciting is that the advancements in today's technology allows for new layers of security and intelligence to be added that don't overburden the user or administrators.."

- Shiv Prabhu, CTO

Delivering multiple levels of security across all areas of operations.
